Operations Visualization

Dashboard is an integrated Portal for real-time monitoring and tracking of all aspects of daily Operations. This application monitors and alerts about the availability of Gate, Equipment, Crew, Passengers, Baggage & Manpower for an On-Time departure.

- View Gate – shows real time flight information at each gate of an airport at any point of time
- View Board (Arrival/Departure Dashboard) - shows Flight, Baggage, Passenger, Equipment, Weather, Crew in a unified view

The application gives the current snapshot of all the activities and information, which gets performed or generated, in a given gate. Once a flight arrives (or is about to arrive) or departs (or about to depart) from a gate, different activities are performed, which in turn generates a large pool of information. The objective is to gather the information and publish in the dashboard so that the CS or the Ramp Personnel can use them to efficiently handle the flight.

Salient Features

- Monitors flight operation, baggage, crew, equipment, passenger and manpower information from a single combined view
- Provides flight arrival/departure information for each gate of an airport in a visual format to increase user retention of data
- Provides only the relevant information to the target user
- Provides the information/data at a time when the outcome of the decision can still be influenced

Benefits

- The system uses a user-friendly web based screen and Asynchronous Web based request-response mechanism, which helps the users to view data according to their preference
- Every user is assigned a security level so that only authorized user can view the data
- User can have a glimpse of current flight allocation at a given gate for a specific station
- Authorized users can also view passenger, aircraft, baggage, and weather related information for a specific flight in a specific gate
